

2016 Site Specific Milfoil Report: Dog Cove

In 2016, our divers removed 18 gallons of variable milfoil from Dog Cove. This quantity is an increase over 2015, which is due to the early ice-out that occurred in the spring of 2016. Despite this increase, the milfoil growth in Dog Cove remains very manageable and only requires the hand-pulling method of removal as opposed to our DASH system, which we use for major infestations. Milfoil in Dog Cove is most often found in small sporadic patches close to the mouth of the river. Our divers also removed small plants around the docks/boat launch off of Laurel Glen Lane.

Year	Gallons
2012	3.6
2013	23
2014	34.5
2015	3
2016	18

To learn more or to see a map of milfoil locations on Squam <https://www.squamlakes.org/milfoil-management-squam> or email Rebecca Hanson at rebeccahanson@squamlakes.org.

Our volunteer Weed Watchers are the first line of defense for previously undetected invasive species growth. Once trained, Weed Watchers scan the shoreline and shallow areas in search of suspicious plant growth. Sign up to volunteer as a Weed Watcher by visiting <https://www.squamlakes.org/volunteer/weed-watching-squam-lakes> or email Brian Gagnon at briangagnon@squamlakes.org.
